Eight hours of battery life. Doing what?

Every performance claim needs a workload, a configuration and a measurement.

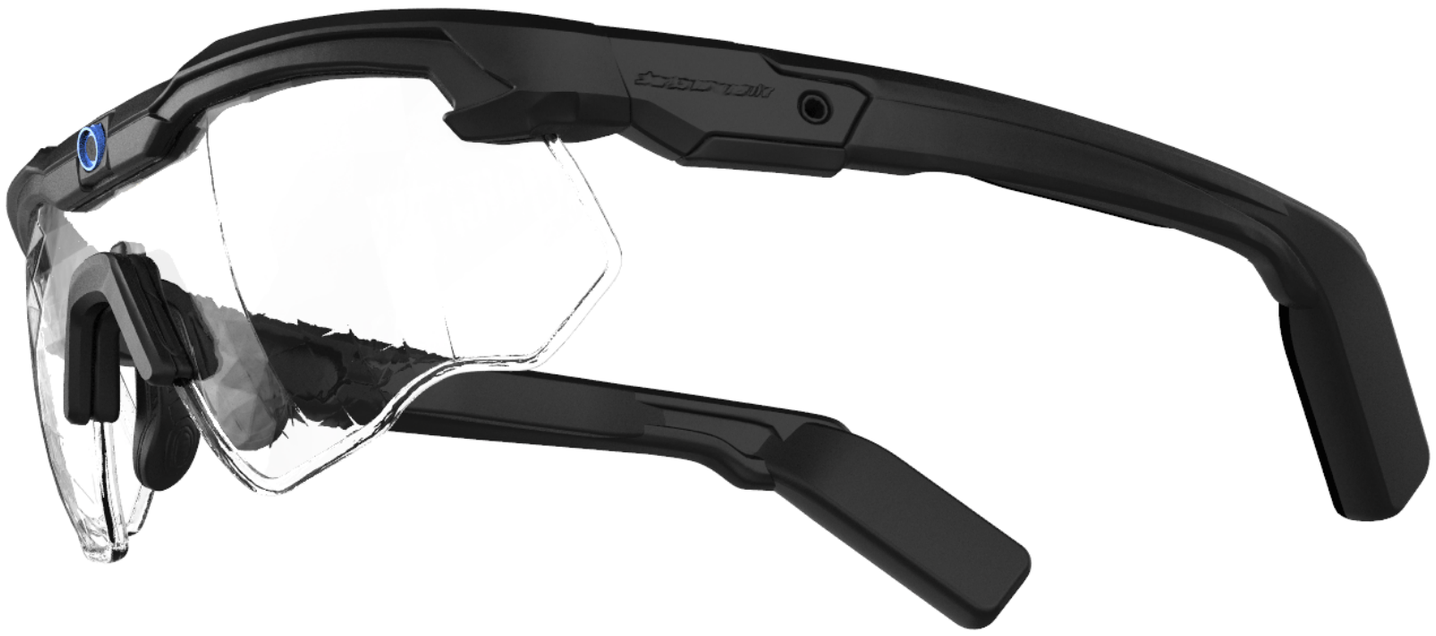

A visual briefing for teams building or buying professional smart eyewear, including three concept design views.

The task is the first specification.

Read the right label.
Record the right inspection.
Reach the right specialist.

Choose one complete workflow. Measure time, correct outcomes, errors and recovery against the current method.

See the form.
Define the work.

Overall concept view. Review lens geometry, nose interface and temple packaging against the intended workflow.

Creators, rights holders and owners of visible marks: SmartXY / Vanda. Public use in SmartXY materials authorized, 12 Sept 2026. Concept reference; final configuration requires validation.

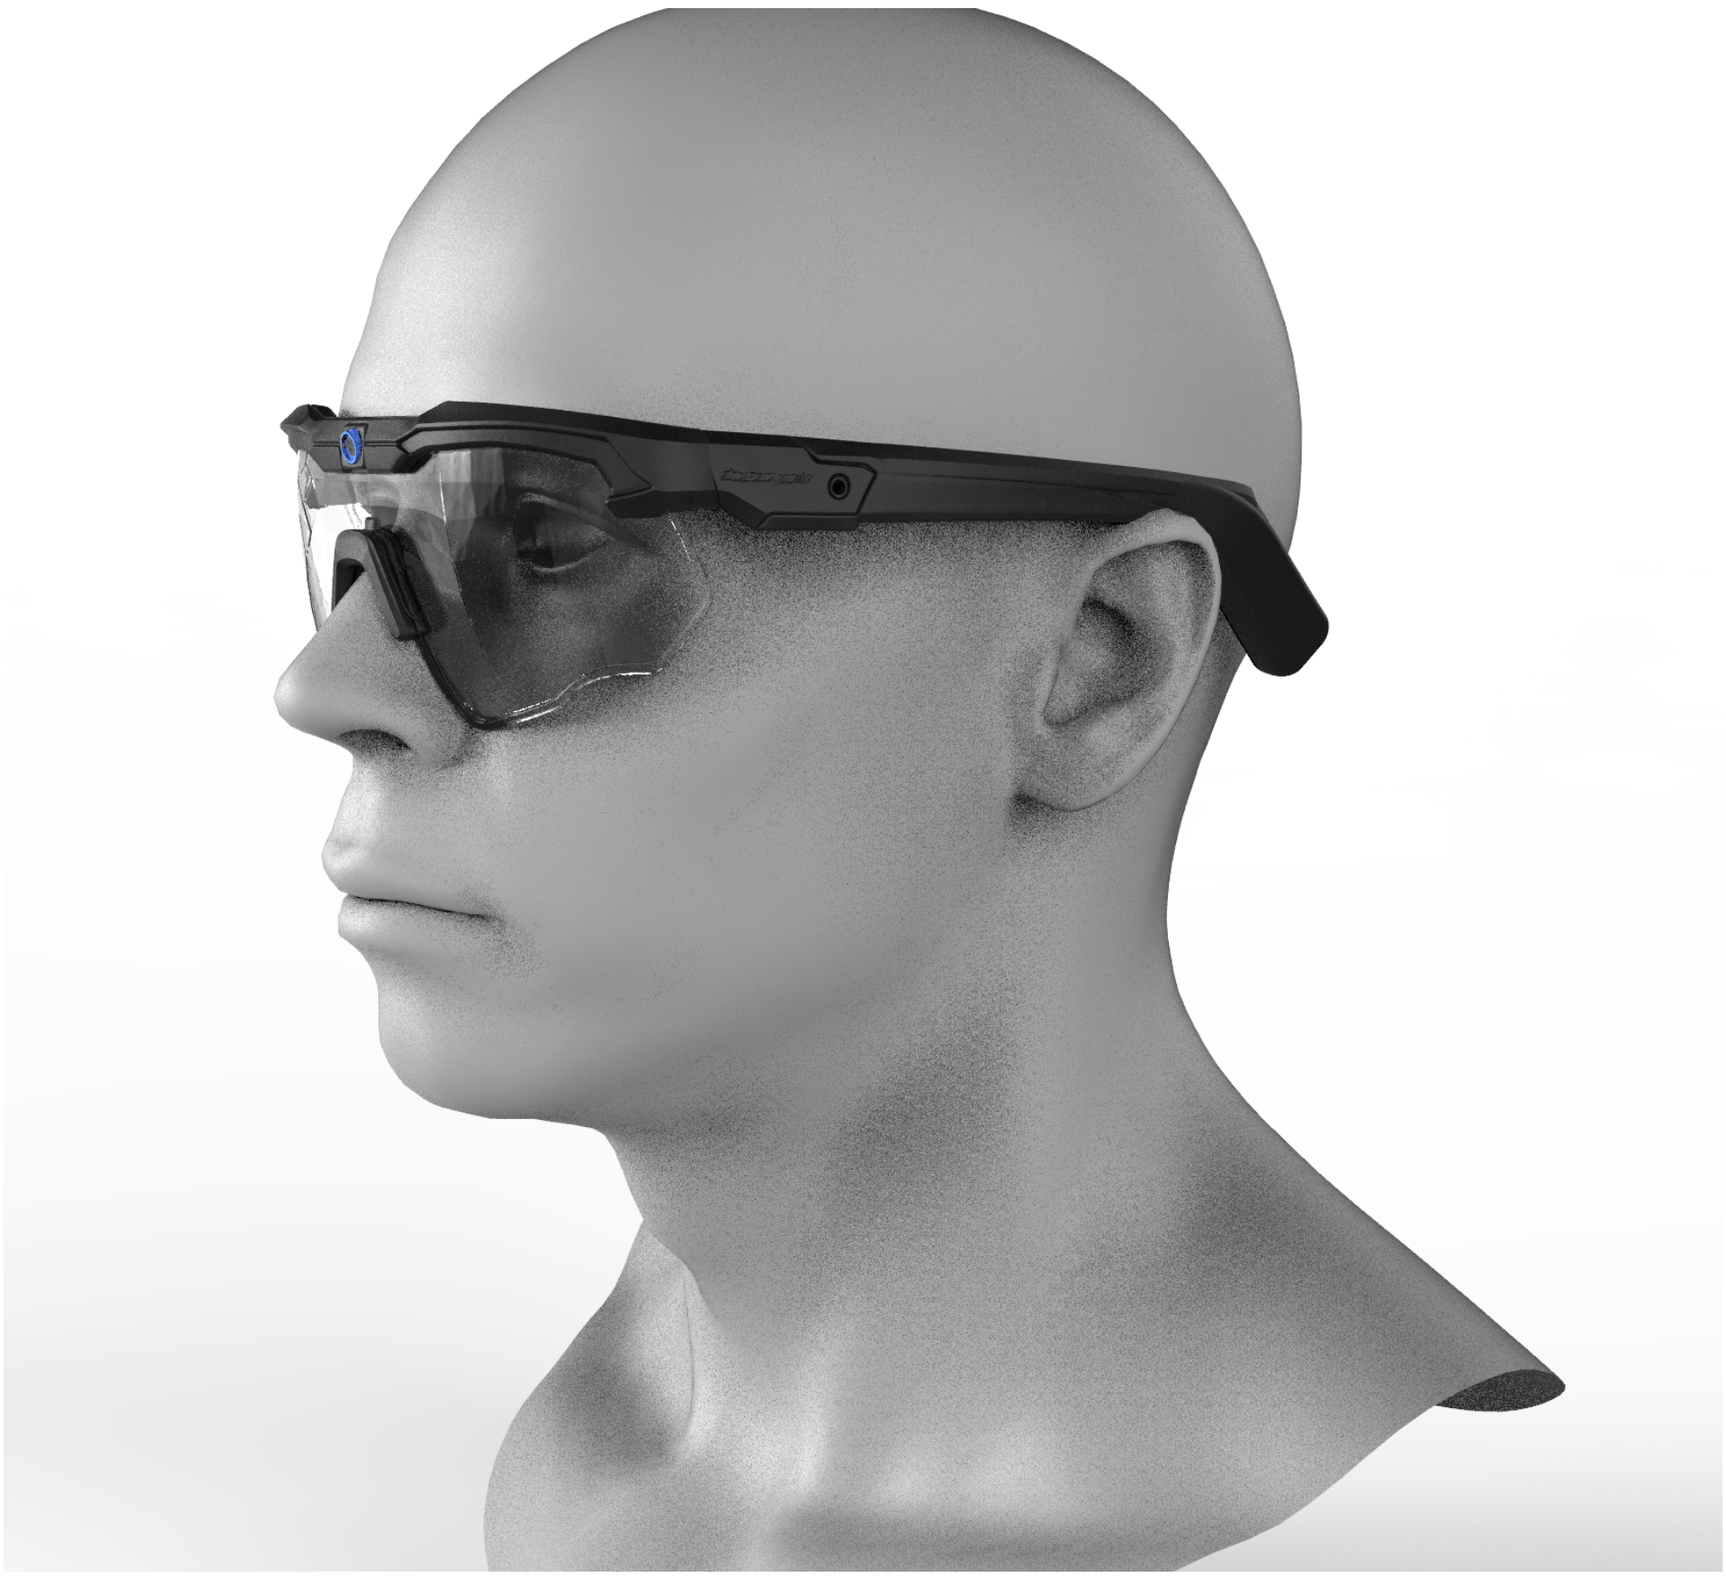

Explore fit from the side.

Side wearing reference. Review temple reach and ear clearance. Edited concept view; detached component removed for presentation.

Creators, rights holders and owners of visible marks: SmartXY / Vanda. Public use in SmartXY materials authorized, 12 Sept 2026. Concept reference; final configuration requires validation.

Review the wearing envelope.

Opposite wearing view. Validate prescription access, eye clearance, stability and compatibility with other equipment.

Creators, rights holders and owners of visible marks: SmartXY / Vanda. Public use in SmartXY materials authorized, 12 Sept 2026. Concept reference; final configuration requires validation.

Put the workload next to the battery-life claim.

0.686 Wh of usable energy
÷ 8 hours ≈ 86 mW average.
÷ 1.6 W ≈ 26 minutes.

Hypothetical example: 0.95 Wh × 85% efficiency × 85% remaining after reserve. Not a product rating. Standby, mixed use and continuous capture need separate claims.

Megapixels describe the sensor. Test the task.

Distance. Motion. Light.
Reflectivity. Focus.
The exact required field.

A megapixel count cannot establish task accuracy. Measure false acceptance, retries and time to a usable result.

“SDK available” starts the conversation.

Which functions exist today?

On which hardware and host?

Can they run together?

Offline must survive the whole workflow. Demonstrate capture, audio, events, updates and recovery. API access, source licensing and ownership are separate deliverables.

The worker has to keep wearing it.

Fit the prescription user.
Measure sustained heat.
Verify the whole voice exchange.

Fit determines who can use the product. Heat sets the terms of sustained use. A voice feature is an entire exchange. Evaluate real wearing sessions with required equipment, noise, feedback and recovery.

A protection claim belongs to a configuration.

Lenses. Frame. Accessories.
Electronics. Prescription parts.
The intended workplace.

A target, test report, declaration and certification are different evidence. Select the assessment route for the hazard and market. References and route notes: complete guide, pp8 and 27.

The spare lens belongs in the business case.

Part + labor + logistics + downtime + support.

Compare replacement, repair and front-module options on the same usage assumptions. Validate cleaning and control compatible service parts.

Each gate should earn the next investment.

Useful task results.
A controlled configuration.
A process that preserves both.

Agree the acceptance evidence at each development gate. Track changes, production variation and field failures. Report trial conditions and limits.

Bring the workflow. Define the product.

Read the Buyer Decision Guide.
Use the 15-question checklist.
Build a reviewable development brief.
